Voluntary Results Feedback Form

- I am an examiner in Workgroup: Example: 1713
- Relevant prior art **found**, search results used as follows:

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature
(journal articles, conference proceedings, new product announcements etc.)

- Relevant prior art **not found**:

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: TRUONG, INC Examiner #: 6932 Date: 4/11/05
Art Unit: 1711 Phone Number 30 2-1681 Serial Number: 10/713,269
Mail Box and Bldg/Room Location: 60271 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: _____

Inventors (please provide full names): _____

Earliest Priority Filing Date: _____

**For Sequence Searches Only* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

Formula of claim 17 y. ~~Derived from~~ ^{derived from} the reactants of
6/74,356 \Rightarrow any other monomer C + monomer D.
Thanks.

 AB Two different approaches toward the syntheses of crosslinked dendritic networks from surface-functionalized polyether dendritic monomers were reported. The first series (type I) of dendritic networks (G1-G3) was prepared by a 3:2 copolymn. of surface bifunctionalized (G1-G3) dendritic monomers having two reactive arylethynyl surface groups with a small size trifunctional organoplatinum branching monomer {tris[trans-chlorobis(triethylphosphine)platinum]mesitylene-2,4,6-triethynylene} containing three reactive chloroplatinum functionalities. Facile network formation was realized for the G1 dendritic monomer, while linear, nonbranching dendritic polymers were predominately produced from the higher generation G2 and G3 monomers. The second series (type II) of dendritic networks (G0-G2) was prepared by a 3:2 copolymn. of a small size bifunctional organoplatinum monomer {bis[trans-chlorobis(triethylphosphine)platinum]-4,4'-biphenylene-1,1'-diethynylene} having two reactive chloroplatinum moieties with surface-trifunctionalized (G0-G2) dendritic branching monomers with three reactive arylethynyl surface groups. Highly crosslinked dendritic networks were formed in all three generation of dendritic monomers. The structures of the soluble, linear dendritic polymers and the insol. dendritic networks were characterized by NMR spectroscopy, gel permeation chromatog., SEM, scanning tunneling microscopy and/or energy-dispersive x-ray spectroscopy. The difference in the copolymn. behavior between these two approaches was rationalized in terms of steric inhibition during crosslinking in the type I dendritic network architecture.

- AB The F-containing poly(aryl ethers), showing high heat resistance and mech. strength, contain I units (R_1 = C1-150 divalent organic group; Z = divalent organic group, single bond; $m = 1-4$) and have OH and/or phosphoric acid groups in R_1 . Solvent-soluble widely-useful engineering plastics are manufactured using compds. containing 2 of phenolic OH groups and ≥ 1 alc. OH groups as starting materials. Also claimed are ionic conductors, useful for electrolyte membranes in fuel cells, etc., comprising F-containing poly(aryl ethers) having OH, carboxy, and/or PO_3H groups and proton conductivity-imparting agents. Thus, 4,4'-bis(2,3,4,5,6-pentafluorobenzoyl) di-Ph ether was copolymd. with Epicure 171N (resin) to give F-containing polyether-polyketone, which was mixed with tungstophosphoric acid and cured to give a film showing electrocond. $3.2 + 10^{-5}$ and $6.4 + 10^{-6}$ S/cm, at 80 and 140°, resp.

OS CASREACT 137:20186

AB The preparation and use of TADDOLates, which are dendritically incorporated in polystyrene beads is reported. A series of styryl-substituted TADDOLs with flexible, rigid, or dendritically branching spacers between the TADDOL core and the styryl groups (2-16 in number) has been prepared. These were used as cross-linkers in styrene-suspension polymerization, leading to beads

of ca. 400-µm diameter. These, in turn, were loaded with titanate and used

for the Lewis acid catalyzed addition of Et₂Zn to PhCHO as a test reaction. A comparison of the enantioselectivities and degrees of conversion (both up to 99%), obtained under standard conditions, shows that these polymer-incorporated Ti-TADDOLates are highly efficient catalysts for this process. In view of the effort necessary to prepare the novel, immobilized catalysts, emphasis was laid upon their multiple use. The performance over 20 cycles of the test reaction was best with the polymer obtained from the TADDOL bearing four first-generation Frechet branches with eight peripheral styryl groups: the enantioselectivity, the rate of reaction, and the swelling factor were essentially unchanged after numerous operations carried out with beads of 400- μ m diameter and a degree of loading of 0.1 mmol TADDOLate/g polymer, with or without stirring. The rate with the dendritically polymer-embedded Ti-TADDOLate was greater than that measured with the corresponding monomer. Possible interpretations of this phenomenon are proposed. A polymer-bound TADDOL, generated on a solid support (by Grignard addition to an immobilized tartrate ester ketal) did not perform well. Also, when polystyrene beads were prepared by copolymer of styrene, a zero-, first-, or second-generation dendritic cross-linker, and a mono-styryl-substituted TADDOL derivative, the performance in the test reaction did not rival that of the dendritically incorporated Ti-TADDOLate. Finally, the dendritically immobilized Cl₂ and (TsO)₂Ti-TADDOLate were applied as chiral Lewis acid to preferentially prepare one enantiomer of the exo and the endo (3 + 2) cycloadduct, resp., of di-Ph nitron to 3-crotonoyl-1,3-oxazolidinone; in one of these reaction modes, an interesting conditioning of the catalyst was observed: with an increasing number of application cycles, the amount of polymer-incorporated Lewis acid required to induce the same degree of enantioselectivity, decreased; the degrees of diastereo and enantioselectivity were, again, comparable to those reported for homogeneous conditions.

OS MARPAT 134:340818

AB The diamine and the acid dianhydride are synthesized so as to have a photoreactive and thermally reactive group having one or more double or triple bonds, especially a skeleton of cinnamic acid, chalcone, benzalacetophenone, stilbene, coumarin, pyrone, allyl, propargyl, acetylene, or derivs. of these, and to combine the photoreactivity with the thermal reactivity characteristic of these reactive groups. The polyimide composition is formed from the diamine and the acid dianhydride, having photoreactivity and thermal reactivity. Reaction of m-nitrobenzoyl chloride with 2,2-bis(bromomethyl)-1,3-propanediol, treating the resulting 2,2-bis(bromomethyl)-1,3-bis(m-nitrobenzoate)propane with Cs 4-fluorocinnamate in DMF, and hydrogenation gave 2,2-bis(4-fluorocinnamate Me ester)-1,3-bis(m-aminobenzoate)propane (I). Reaction of I with 2,2-bis(4-hydroxyphenyl)propane-3,3',4,4'-tetracarboxylic acid dianhydride in DMF and stirring the polyamic acid solution with Ac2O, β -picoline, and DMF gave a polyimide with weight mol. weight 9.2×10^4 .

AB	The title dendrimers comprise a member selected from the group consisting of an $\alpha,\alpha,\alpha',\alpha'$ -tetraaryl-1,3-dioxolane-4,5-dimethanol moiety and an $\alpha,\alpha,\alpha',\alpha'$ -tetraaryl-1,3-dioxolane-4,5-dimethanolate of titanium (IV) moiety, the moiety comprising a dendritic substituent, wherein the dendritic substituent is bound to an α or an α' aryl group. Their use as crosslinkers in polymerization reactions and the use of Ti salts of polymer-bound TADDOL dendrimers as catalysts in enantioselective addition reactions are disclosed. A copolymer of styrene and (4R,5R)-2,2-dimethyl-a,a,a',a'-tetra(4-(3,5-di(4-vinylbenzyloxy)benzyloxy)phenyl)-1,3-dioxolane-4,5-dimethanol was reacted with titanium tetraisopropoxide to give a catalyst useful in reaction of diethylzinc and benzaldehyde.

AB The objective of this research was to investigate the effect of
introducing multiple alkyl side chains on the properties of aromatic
polyetherimides. Especially those polymers have excellent elongation and can be
used as stretchable films in applications of liquid crystal display (LCD)
alignment layers. Polyetherimides are prepared from 2,2'-bis[4-(3,4-
dicarboxyphenoxy)phenyl]propane dianhydride with 3,4,5-tris(n-alkyl-1-
oxy)benzyl diaminobenzoate or benzidine 3,4,5-tris(n-alkyl-1-oxy)benzoate.

AB TADDOL was modified with styryl group-containing dendrimer and aryl ether
linkers and copolymerized with styrene to give a copolymer that was complexed
with Ti. The complex was used to catalyze the stereoselective ethylation
of PhCHO. All the catalysts showed high selectivity initially, but only
the dendrimer-modified TADDOLate retained its selectivity through repeated
catalysis cycles.

AB TADDOLs ($\alpha, \alpha, \alpha', \alpha'$ -tetraaryl-1,3-dioxolane-4,5-dimethanols) with dendritic branches attached to the aryl groups and with 8 or 16 peripheral styryl double bonds were synthesized. With these compds., dendritic mols. were employed for the first time as crosslinkers in a polymerization. The resulting polystyrene was loaded with titanate ($\text{Ti}(\text{OCHMe}_2)_4$) to generate polymer beads incorporating Ti-TADDOLate centers for enantioselective catalysis (Et_2Zn addition to PhCHO). Compared with conventionally polymer-attached, insol. Ti-TADDOLates, the new materials

- have a much higher catalytic activity, rather close to that of soluble analogs.

 AB Soluble polyesters are synthesized by polymerizing a range of bis(acid chloride)s with the bisphenol that is formally the Diels-Alder adduct of 9,10-diacetoxy-2,6-dihydroxyanthracene and di-Me maleate. Heating the soluble polyesters to about 230° brought about retro-Diels-Alder reactions to give the insol. target polyesters containing 9,10-diacetoxyanthracene residues.

AB Two series of rigid and semi-rigid polyesters and polyamides with flexible side chains were prepared by solution, melt and interfacial polycondensation of 2,5-dialkoxyterephthaloyl chloride with various diols and diamines. The thermal behavior of the polymers were studied by DSC, TGA and polarizing microscopy. The results indicated that only rigid polymer systems form a nematic mesophase. However, none of the semi-rigid polymers formed nematic melts. The structures of both polyesters and polyamides were also examined by wide angle x-ray scattering. Anal. of sharp reflections, appearing at the lower angle of x-ray diffractograms of rigid polymers, suggested that rigid polymers crystallized to form a layered structure in the solid state.

 AB A series of wholly aromatic polyesters with flexible side chains was synthesized by solution and melt polycondensation from several aromatic diols with 2,5-dialkoxypthaloyl chlorides. The majority of these polymers were soluble in p-chlorophenol, THF, DMF and CHCl₃ at elevated temps. and melting temps. could be systematically reduced by increasing the length of the side chains. The inherent viscosity measured at 45° in p-chlorophenol was 0.15-2.51 dL/g and initial decomposition in TGA occurred at 275 .apprx. 326°.

 AB The potential for evaluating a rate constant by gel chromatog. was tested using the recently reported alkaline dissociation of insulin (I) from dimer to monomer. The value of 0.0113 min⁻¹ was obtained for the 1st-order rate constant k by this method; that value is in accord with zonal studies of I dissociation

 AB The basal glucose [50-99-7] utilization by epididymal isolated adipose tissue from rats treated with fluphenazine (I) [69-23-8] (0.01 mg/100 g/day for 6 weeks) increased parallel to the glucose concentration in the incubation fluid, while an opposite effect was observed with adipose tissue from rats treated with a hormone complex consisting of hydrocortisone hemisuccinate [2203-97-6], testosterone propionate [57-85-2], stilbestrol dipropionate [130-80-3], and insulin zinc protamine [9004-17-5]. The above basal level utilization of glucose in response to insulin was high and increased quickly and proportional to the glucose concentration in the incubation fluid with tissue from either I or the hormone complex-treated groups. trifluoperazine [117-89-5] (0.05 mg/100 g/day for 6 weeks) treatment of rats did not alter the basal glucose utilization by their adipose tissue compared to that untreated controls.

 AB Fluphenazine (I) [69-23-8] (0.01 mg/100 g, daily); trifluoperazine (II) [117-89-5] (0.05 mg/100 g, daily); or a hormone complex (III), consisting of hydrocortisone hemisuccinate [2203-97-6], testosterone propionate [57-85-2], stilbestrol dipropionate [130-80-3], and insulin zinc protamine [9004-17-5], were administered i.p. to rats over 6 weeks. In the absence of insulin [9004-10-8], the sciatic nerve released glucose [50-99-7] into the incubation fluid; this effect was not affected by I or II but potentiated by III. In the presence of insulin, glucose uptake by sciatic nerve was proportionate to the level in the incubation fluid; the uptake was increased by I and II, and abolished by addition of III.
